

# Course Code: ITC11

## Course Name: Mini Project

Credit Scheme			Evaluation Scheme				
Lecture	Practical	Credit	Internal			External	Total
			Written	Practical	Tutorial		
-	10 Hrs./Week	5	-	75	-	50	125

### Course Description:

A mini project is an assignment that the student needs to complete at the end of every semester to strengthen the understanding of fundamentals through effective application of the subjects learnt.

#### *Course Outcomes:*

Student will be able to

CO1: Create working project using tools and techniques learnt in this semester (Create)

#### *Course Structure:*

#### **Guidelines for Mini Project**

1. Students are expected to undertake one mini project starting from first semester till third semester.
2. The student may take up the mini project in first semester based on the courses learnt in that semester and for every next semester the mini project may be based on the courses learnt in the current semester along with all the subjects learnt in earlier semesters.
3. The student may take up the project individually or in group. However, if project is done in group, each student must be given a responsibility for distinct modules.
4. Selected project/module must have relevant scope as per the marks assigned and must be carried out in the Institute.
5. Internal guide should monitor and evaluate the progress of the project on individual basis through handwritten workbook (Project Diary) maintained by students containing various project milestones with learnings and remarks from internal guide for concurrent evaluation.
6. The Project Synopsis should contain an Introduction to Project clearly stating the project scope in detail justifying enough scope for 125 marks. The project work will carry 75 marks for internal assessment and 50 marks for external assessment.
7. Students are expected to show working demo of the project during final evaluation.
8. Students are expected to submit the soft copy of mini project report as a part of final submission.
9. The project will be assessed internally as well as externally by the examiners appointed by University. University may appoint Industry Experts as an external examiner

**Course Code: ITC41**  
**Course Name: Project**

Credit Scheme			Evaluation Scheme				
Lecture	Practical	Credit	Internal			External	Total
			Written	Practical	Tutorial		
-	40 Hrs./Week	22	-	250	-	300	550

**Course Description:**

A project is an assignment that the student needs to complete at the end of semester IV to strengthen the understanding of fundamentals through effective application of the subjects learnt.

*Course Outcomes:*

Student will be able to

CO1: Create working project using tools and techniques learnt in the programme (Create)

*Course Structure:*

The project is an outcome of technical skills and domain knowledge acquired by the students during the program. Students demonstrate problem solving skills, analytical ability, logical thinking, communication skills and team work during the course of the project. The project can be implementation of a research work published in any reputed journal.

1. The project may be done individually or in groups. However, if project is done in groups, each student must be given a responsibility for distinct modules.
2. Selected project/module must have relevant scope as per the marks assigned and can be carried out in the Institute or outside with prior permission of the Institute.
3. Internal guide should monitor and evaluate the progress of the project on individual basis through handwritten workbook maintained by students containing various project milestones with learnings and remarks from internal guide for concurrent evaluation.
4. The Semester IV project should be having sufficient scope for 400 marks. The project work will carry 300 marks for internal assessment and 250 marks for external assessment.
5. Students are expected to show working demo of the project during final evaluation in semester IV.
6. The project report should be prepared as per the University prescribed format with all the chapters mentioned in project guidelines. And it should be printed on back-to-back pages (one copy) which should be signed by the internal guide and the Director of the Institute. A client

(colleges, Non IT organization, and IT organization) certificate should be attached to prove the authenticity of the project work done.

7. The project will be assessed internally as well as externally by the examiners appointed by the institutions and University.

## **Type of Projects**

### **1. Application Development**

The students are advised to choose a project that involves window-based development, web-based development, mobile-based development, projects based on machine learning. Analysis and interpretation of any company specific data is not permitted.

### **2. Embedded Systems / IoT**

A project should be developed and implemented for application specific system after thorough investigation of the latest development in the field of electronics or communication to facilitate their efficient operation. The Real Time Operating System (RTOS) or open source platform can be used to develop embedded applications such as Robotics, Microcontroller / Microprocessor based projects etc. An IOT project can be used to design products for reliability and security using simple electronics concepts and integrating with a cloud platform to get the data real-time and make some operational analysis. It has to use efficient algorithms for strong authentication and security protocols and disable non-essential services.

Few examples of IoT applications

Smart home, Health care applications, Smart waste management, Activity Tracker etc.

### **3. ETL Projects**

Extract, transform, load (ETL) is the process of integrating the data from one or more sources. It is expected from the student that he should demonstrate the entire ETL process with reference to any domain like finance, banking, insurance, retail etc.

Data extraction consists of extracting the data from homogeneous or heterogeneous sources and transforming it into a proper format using data cleansing. The data can be finally loaded into a final target database such as operational data base, a data mart or data warehouse. This data can be further used for the purpose of querying and analyzing.

### **4. Research Projects**

The research project will be able to demonstrate the skills of working scientifically, and through the project the students will be able to understand how to do a literature review, and how to appraise the literature to address questions. To explore an area of interest (develop some expertise and a deeper understanding of a topic). Understand the tools to critically and thoughtfully appraise problems which are faced every day; to learn communicate scientific research in verbal presentations and written form. As an example, the students can identify any problem, by observation or through survey to understand the problem in depth and propose the solution by applying the research methodology.

### 3. ETL Projects

Chapter No		Details
<b>1</b>		<b>Introduction</b>
	1.1	Company Profile / Institute Profile / Client Profile
	1.2	Existing System functionality (Source System for which the ANALYTICS is being developed)
	1.3	Business process understanding and specifications 1.3.1 Business Requirement Specifications: 1.3.1. 1 The o/p from BR Analysis are BRS Business Requirement Specifications (Business specific Rules to be mentioned here from analysis point of view) 1.3.1.2 Identify the dimensions, required attributes, measures, filter conditions, adjustments for KPIs going to be used in the Target system and its availability in the Source System. If any gaps suggest remediation of gaps 1.3.2 Business Rules Collection 1.3.3 Identify the Key Performance Indicator (specified by client) 1.3.4 Establish the User Acceptance Criteria
	1.4	Scope of the project
	1.5	Operating Environment - Hardware & Software, Description of Tools / Technology to be used in the Target system 1.5.1.1 Operating systems used (Windows or Unix) 1.5.1.2 RDBMS/NoSql used to build database (mysql/ oracle, Teradata, etc.) 1.5.1.3 ETL tools used (Talend/Informatica, Datastage etc) 1.5.1.4 OLAP/ Data mining/ machine learning/ analytics tools used (Python/ Cognos, BO, etc.) 1.5.1.5 Data visualization tools (power BI / Tableau)
<b>2</b>		<b>Proposed System</b>
	2.1	Creating multiple ETL strategies - Specifying metadata details, identifying heterogeneous architectures, processes for I/O only for ETL,

		scrapping , identifying the volatilities in the channels , designing strategies in the context of the business and existing ERP
	2.2	Comparing them in the context of selected business system (as per the business requirements)
	2.3	Suggesting optimum solution (process)
<b>3</b>		<b>Analysis and Design</b>
	3.1	Use Case Diagram
	3.2	Activity diagram to demonstrate Process flow (execution of ETL process)
	3.3	Design of Target system (Elaborate the tiers of DW architecture in the Target System)
	3.4	Database schema / Table specifications of Target system
	3.5	Details of Source & Targets of mapping in the database
	3.6	Details of Load (Full/Incremental etc.)
	3.7	Design of ETL schema/strategy
<b>4</b>	<b>4.1</b>	<b>Design of strategy for Visualization</b> 4.1.1 Visualizations in support of comparison of performance of various ETL strategies 4.1.2 Data visualization using different techniques (if any)
<b>5</b>		<b>Drawbacks and Limitations Proposed Enhancements</b>
<b>6</b>		<b>Conclusion</b>

#### 4. Research Projects

Research projects especially are designed to gain knowledge about some specified area and the deliverable is that knowledge gained, usually encapsulated in some form of report.

Students are expected to contribute something new to academic or practical knowledge in their research area—something original that is more than the accepted knowledge.

Completing a Research Project as part of your coursework is an opportunity to:

- learn to read and interpret other people’s research critically by doing your own. This gives you an insight into the effects of practical difficulties and theoretical debates on published research
- develop and apply the knowledge that you have learnt in 4 semesters of your curriculum.
- submit a paper for peer-reviewed publication. (If successful, this will give a boost to your c.v.) If you wish to enroll in a research degree such as PhD, a research project as part of your coursework will assist the committee evaluating your application in assessing whether you are ready to do independent research.

#### Research Index

1. Title page
2. Acknowledgements

You should acknowledge the assistance given to you by your supervisors, and any other person or organization that has helped you in the planning, conduct, analysis or reporting of your project.

### 3. Abstract

This is a synopsis of your study question, aims and objectives, background literature, methods, results, key conclusions and recommendations. This should be 250–300 words long and should be very clear and easy to follow.

### 4. Introduction

In this section of your report you introduce the subject, provide the background to the topic or problem, outline the study question (or problem or study hypothesis), and outline the aims and objectives of your study.

### 5. Literature review

This is a review of the literature on the topic or problem you are studying. It should include a review of any other studies or projects similar or relevant to yours, and perhaps a review of the literature on the method you have chosen if your project tests a new method of research or analysis.

### 6. Methods

This section includes the methodology of your research. It will cover such issues as:  
In case of Computer Management Research :

- Study design
- Study population, sampling frame and numbers, sampling method
- survey design
- survey or data collection instruments
- protocol for obtaining data
- ethical issues and how they are addressed
- information letters, consent forms
- data management and analysis methods
- statistical analysis and tests
- In case of Computer Science Research:
  - Study design
  - System Architecture
  - Implementation
    - Experimental Implementation
    - Simulation
  - Data management and analysis methods
  - Analysis and testing

### 7. Results

In this section you present the results of your research. Tables, figures and graphs are an excellent means of presenting this sort of information. All tables, figures and graphs, should be numbered consecutively throughout the whole report, and labelled with a clear and concise descriptive title.

## 8. Discussion

In this section you interpret your results and discuss their implications, with reference to other published research. Any limitations in your research methodology should also be referred to here. Examiners expect you to acknowledge these limitations as an integral part of your evaluation of your project.

## 9. Conclusion

This section summarizes the key results and the conclusions that you can draw from these results. It also needs to reflect what your initial project aims and objectives were.

## 10. Recommendations

It is good research practice to make recommendations or to suggest directions for further research or actions as a result of your project findings.

## 11. References

This is a list of all the references and sources you used in your literature review, methodology and discussion. This includes books, journal articles, abstracts, conference and symposium papers, media articles, and any form of published literature or comment.

## 12. Appendices

This section may contain copies of any questionnaires if any or evaluation instruments used covering letters, participant information and ethics approvals, or additional explanations.

## Chapter 1

### 1. Introduction:

In the current business scenario use of digital tools have become crucial. Upcoming domains like Business Intelligence, Artificial Intelligence, Machine Learning, NLP, etc. are helping companies improve the quality of their decision making.

Business Intelligence helps companies monitor trends, adapt to varying market conditions, and improves decision making at all levels of the organization. The BI tool a company uses depends on their goals. Some companies are interested in gaining insights into consumer buying other companies are interested in improving employee productivity or seeing who the best performers are. There are an infinite number of ways companies can deploy a business intelligence solution. Some Key Benefits of using Business Intelligence are Fast and accurate reporting, Valuable Business Insights, Identifying Market Trends, Improved accurate decisions.

Business Intelligence Tool for Accounts is a web based application which is used to display data visualizations of the accounting data. The web application looks at the same data with different perspectives which adds meanings to the accounting data and helps the user take a better informed decision.

## **1.1 Company Profile**

This project does not belong to any company.

## **1.2 Abstract**

The current accounting system does not have data visualization feature and also the budgeting feature was missing. Objective of the system is to create a generic BI tool for any accounting system based on universal standards. The users would map data required by BI tool with their data from accounting system. User will now enter budgets for all expense heads imported from accounting system. The transactions for the time period selected by the user will then be imported at regular intervals. Data visualizations are then generated on such imported data. Budget variance visualization is generated as a comparison between master data entered by the user and summary of transactions imported.

## **1.3 Existing System and Need For The System**

All existing accounting software have only financial reports so reports are required to export data to excel and create data visualization manually. This process is prone to errors and is very time consuming. This gives birth to idea of the proposed system.

### **Need For System**

- To get better interpretation of data which will lead to better business decisions and eventually profit oriented business strategies.
- Any existing accounting system normally generates reports based on accounting principles and regulatory compliances. There is no provision to generate data visualization required for business decisions. Such things are then done manually in the company as and when required. This process is time consuming and prone to errors.
- Absence of budgeting in accounting system made the users calculate budget variance manually which is again time consuming and prone to errors.
- Highly competitive business environments make a company look at the accounting data with a 360<sup>0</sup> view.

## 1.4 Scope of System

- To do data mapping that is to bridge the differences between two systems or data models so that when data is moved from a source, it is accurate and usable at the destination.

Data mapping includes the following:

- Sales and Purchase Data: The sales/purchase, respective master data from original accounting system is mapped to the denormalized design in this application.
  - Expense Heads Data: The expense heads data are mapped to budget table in this application.
- Importing data in system which will help us to organize, clean, analyze data and act upon this unified data view in ways that are better aligned with your specific and unique business needs.
    - In this process date filter will be provided so that the user can choose to import data from original accounting system to this system as and when required.
  - To create filterable dynamic data visualization which makes it easier to identify and share real-time trends, outliers, and new

insights about the information represented in the data with different dimensions and perspectives.

## 1.5 Operating Environment

- **Hardware Platform:**

Microprocessor: Core 3 and above

RAM: 2GB and above

HDD: 4GB and above

- **Software Platform:**

**Frontend:** Python with Django Framework

Python is an interpreted, object-oriented, high-level programming language with dynamic semantics. Its high-level built in data structures, combined with dynamic typing and dynamic binding, make it very attractive for Rapid Application Development, as well as for use as a scripting or glue language to connect existing components together. Python's simple, easy to learn syntax emphasizes readability and therefore reduces the cost of program maintenance. Python supports modules and packages, which encourages program modularity and code reuse. The Python interpreter and the extensive standard library are available in source or

binary form without charge for all major platforms, and can be freely distributed.

Django is a high-level Python web framework that encourages rapid development and clean, pragmatic design. Built by experienced developers, it takes care of much of the hassle of web development, so you can focus on writing your app without needing to reinvent the wheel. It's free and open source. Django was designed to help developers take applications from concept to completion as quickly as possible. It takes security seriously and helps developers avoid many common security mistakes.

**Operating System:** Windows 8.1 and above, Linux

**Web Browser:** Google Chrome

## **1.6 Brief Description of Technology Used**

### **1.6.1 Operating System: Windows 8.1**

Windows 8.1 is an operating system designed by Microsoft. Windows 8.1 is very similar to Windows 8, but it addresses some of the problems people had with Windows 8. The load and boot up speed have improved considerably over Windows' predecessors. This is moderately due to the enhanced resource allocations to the

applications and the system. When compared to Windows 8 desktop CPU, Windows 8 .1 has an even speedier boot time.

The safety is the main concern for any operating system. Windows 8.1 makes the best of security. The authentication method of the windows is provided by two ways by PIN and the picture passwords. Windows 8.1 is the most secure version of Windows yet.

Windows defender and also the smart screen filtering makes Windows 8.1 operating system to run without antivirus from the third vendors and booting is also secured.

### **1.6.2 Database: MySQL**

MySQL is an Oracle-backed open source relational database management system (RDBMS) based on Structured Query Language (SQL). MySQL runs on virtually all platforms, including Linux, UNIX and Windows. Although it can be used in a wide range of applications, MySQL is most often associated with web applications and online publishing.

MySQL is based on a client-server model. The core of MySQL is MySQL server, which handles all of the database instructions (or commands). MySQL server is available as a separate program for use in a client-server networked environment and as a library that can be embedded (or linked) into separate applications.

## Chapter 2

### 2. Proposed System

#### 2.1 Study of Similar System

Similar system doesn't exist and this system is fulfilling a gap in the current offerings of such accounting system. These accounting systems provide all accounting and compliance reports. But business decisions require a different perspective of the data so that the insights can assist in decision making and strategy formulation. These are generally found as visualizations in a high end business intelligence application with very high license in fees and complex, time consuming implementation cycle. This application attempts to plug-in the gap in current offerings of the accounting systems by enabling visualization on the existing accounting data, thereby providing different, useful insights for decision support.

#### 2.2 Feasibility Study

##### 1. Executive Summary:

This project is about building a web application for generation of data visualization and budget variance. Python and Django framework are both open source and free even for commercial use. Hence no investment is required to create the application in

Django. MySQL used as the database in this application is also open source and free.

- As Django framework in python will be used to create this web application, so it will be scalable, secure since security is a major concern in accounting data, and has a wide variety of data visualization libraries available to create interactive charts and dashboards.
- Since Django is scalable it can easily cater to increasing number of application users.
- The database of the system will be in denormalized form therefore no joins will be used for query creation resulting in faster data extraction and results.
- Users are already well versed in accounting terminology and analytical reports. Hence minimal amount of training will be required.
- Mapping requires knowledge of the database design of the original software and the IT team is well conversant with this.

This web application is an affordable way to do activities in the scope as it only requires an internet browser and account creation in the application.

## **2. Background:**

Drawbacks of the existing system are:

- Slow processing due to older technology.
- Prone to errors and time consuming as the data will be first imported in excel and then data visualizations are created manually.
- No provision to set budget.

The investigation was done to know the problems that are demanding a Modern solution and other modern ways to perform the smooth processes in shorter time that are required for decreasing the loss of time of the organization and increasing profit with the increase in ability to respond proactively to the market competitors.

The study and research have been provided to increase the efficiency and productivity of the users of the system.

### **3. Purpose:**

The feasibility study is needed to be done as it finds out the possible methods of dealing with problems that may arise during implementation of this application along with the overall idea of a system and its assessment whether it is favorable for the Organization.

Purpose of this system:

- To create visualization for the accounting data.

- To simplify the process of generating visualization while making it accurate and fast.
- To provide the users and option to enter the budget for expense heads.
- To generate a budget variance (budgeted vs. actual).

#### **4. Research:**

- The analysis process comprised of focused discussion with the admin and other users of the existing system.
  - Discussions were held with the senior management to understand their requirements about data visualization.
- Study of the existing manual process.
- Problems in the existing system.
- Requirements about budget were discussed with the key decision makers in the accounts.

The following point serves the processes and methodologies of proposed system:

##### User Administration:

- The default user of the application will be “Admin”.
- Mapping is only allowed for the admin user.

- The admin will then create further users in the application and assign appropriate access rights to various features in the application.
- The users will then login using credentials set up by the admin.

#### **5. Alternative Solution:**

Using 3<sup>rd</sup> party tools: One of the alternative solutions is to use 3<sup>rd</sup> party tool like excel or power BI. The main limitation of these 3<sup>rd</sup> party tools is their inability to use normalized database for generation of flexible visualization. They can only generate static charts. An additional point is their cost of licensing.

#### **6. Recommendation:**

In light of drawbacks of alternative solution, the web application to be made in Django is a simple, cost effective, flexible, scalable and fast performing solution.

#### **7. Conclusion:**

The proposed web application is the best solution considering all feasibility parameters.

### 2.3 Objectives of Proposed System

- To allow admin the feature of user administration that is to allow admin to create user and assign appropriate access rights.
- To map existing applications normalized database to denormalized database of the proposed application.
- To import data from existing system at any specific interval.
- To generate visualizations based on customers, suppliers, items and expense heads dimensions.
- To generate budget variance.

### 2.4 Users of System

- **Admin:**  
Admin is the super user of the system with access to all features in the web application. Admin can perform operations on the system like creation of new users, marking users inactive, assigning appropriate access rights, mapping the existing applications normalized database in the web applications denormalized database, import data and generate visualizations as and when required.
- **Accounts :**  
Users of Accounts department will be able to import data for a specific period, set and modify budget per expense head,

create expense head dimension's visualization, generate budget variance as per the access rights assigned by the admin.

- **Sales :**

Both the user and the managers of sales department will be able to import data for a specific time (if needed), generate visualizations based on the customers and items dimensions as per access rights assigned by admin.

- **Purchase:**

Both the user and the managers of purchase department will be able to import data for a specific time (if needed), generate visualizations based on the suppliers and items dimensions as per access rights assigned by admin.

- **Top Management:**

Top management will have all the rights similar to admin except database mapping, budget entry and importing of data. Item dimension visualization for top management will also include an additional analytical view point of profit.

## Chapter 3

### 3. Analysis and Design

#### 3.1 System Requirement

##### 3.1.1 Functional Requirements:

- Creation of users.  
Admin will create users.
- Assigning access rights.  
Admin will give access rights according to users department.
- Stores user administration data.  
Data of users will be stored in database.
- Mapping of existing applications normalized database with this applications denormalized database.  
Admin will map required data with this application's database.
- Store mapping masters.  
Admin will store mapped data in database.
- Set budget per expense heads.  
Admin and accounts department user will set budgets of expense heads.
- Store budget master.

Data will be stored in budget master.

- Importing of data for the user given time period.

Data for the given date range will be imported by the users.

- Store data for sales, purchase, items, expense heads in the denormalized tables.

Imported data will be stored in database.

- Generation of sales visualization.

Sales wise visualization will be generated.

- Generate purchase visualization.

Purchase wise visualization will be generated.

- Generate item visualization.

Item wise visualization will be generated.

- Generate Expense head visualization.

Expense wise visualization will be generated.

- Generate budget variance.

Budgeted Vs Actual visualization will be generated.

### **3.1.2 Non-Functional Requirements:**

- Performance Requirement:

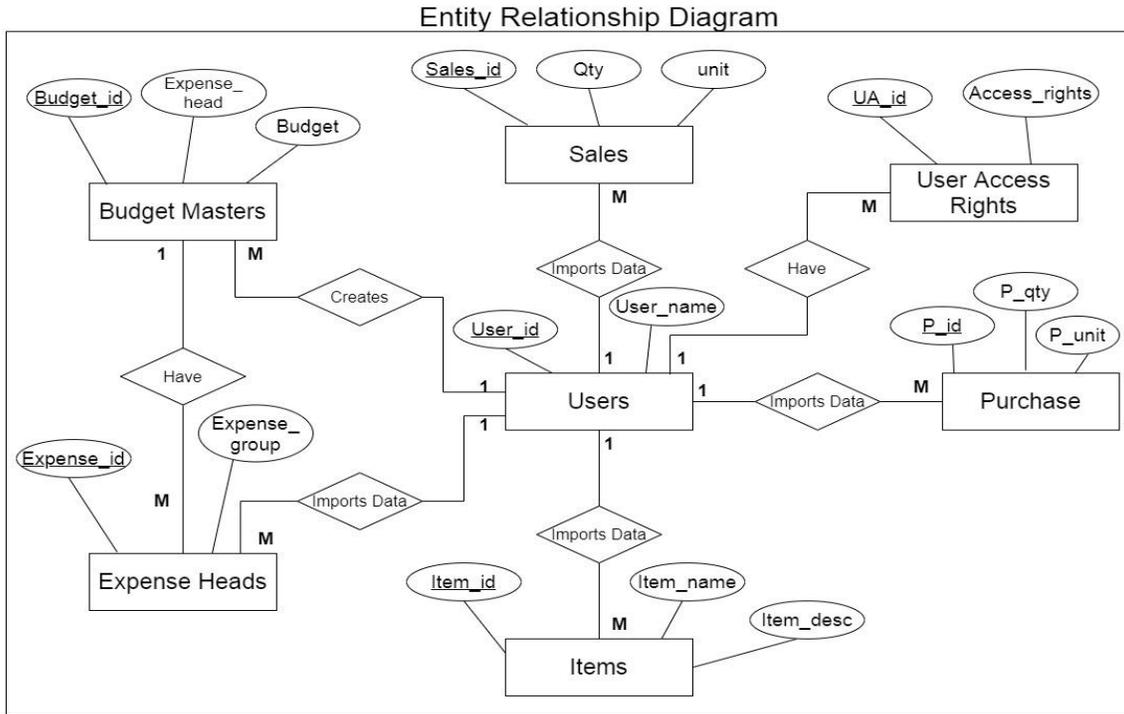

System should run 24/7.

- Safety Requirement:

Database backup is taken once in a day through scheduled database task in the inactive hours.

- Security Requirement:  
Only authorized users can access the system.
  
- Software Quality Attributes:
  - It is reusable.
  - It is accurate, reliable and Flexible.
  - It is user friendly and fast in operations.

### 3.2 Entity Relationship Diagram

### 3.3 Table Structure

#### Sales

Field Name	Data Type	Constraint
Sales_Id	Integer	Primary Key
Customer_name	Varchar	Not Null
Customer_category	Varchar	Not Null
Invoice_no	Varchar	Not Null
Invoice_date	Date	Not Null

## **1.0 Introduction:**

The purpose of Campus Recruitment System is to automate the existing manual by the help of computerized equipment and full-fledged computer software system fulfilling their requirements, so that their valuable data information can be stored for a longer period with easy accessing and manipulation of the same.

The required software and hardware are easily available and easy to work with Campus Recruitment System, as described above, can lead to error free, secure reliable and fast management system. It can assist the user to concentrate on their other activities rather to concentrate on the record keeping. Thus it will help organization in better utilization of resources. The organization can maintain computerized records without redundant entries. That means that ne need not be distracted by information that is not relevant, while being able to reach the information.

The aim is to automate its existing manual system by the help of computerized equipment and full-fledged computer software, fulfilling their requirements, so that their valuable data/information can be stored for a longer period with easy accessing and manipulation of the same. Basically the project describes how to manage for good performance and better services for the clients.

### **1.1Objective:**

The main objective of the Project on Campus Recruitment System is to manage the details of College Company, Job, Student, Vacancy. It manages all the information about College, Placement, Vacancy ,College. The project is totally built at administrative end and thus only the administrator is guaranteed the access. The purpose of the project is to build an application program to reduce the manual work for managing the College. Company, Placement, Job. It tracks all the details about the Job, Student

## **1.2 Existing System:**

The old manual system was suffering from a series of drawbacks. Since whole of the system was to be maintained with hands the process of keeping, maintaining and retrieving the information was very tedious and lengthy. The records were never used to be in a systematic order there used to be lots of difficulties in associating any particular transaction with a particular context. If any information was to be found it was required to go through the different registers, documents there would never exist anything like report generation. There would always be unnecessary consumption of time while entering records and retrieving records. One more problem was that it was very difficult to find errors while entering the records. Once the records were entered it was very difficult to update these records.

## **1.3 Need and Significance:**

The "Campus Recruitment System" has been developed to override the problems prevailing in the practicing manual system. This software is supported to eliminate and in some cases reduce the hardships faced by this existing system. Moreover this system is designed for the particular need of the company to carry out operations in a Smooth and effective manner

## 1.4 Modules:-

- **Admin Login:-**

Admin login has the main control and all functional rights of the system the admin can check the companies and students input and can take action according to the situation

- **Student Login:-**

Student login is for the students where they will register themselves, make their profile, upload their resume and can apply for the job. They can also check the latest updates of the new vacancies in different projects and can apply for them

- **Company Login:-**

The company login can update there are new vacancies on the system .They can see the students profile and can directly contact with the students

## **2.0 Requirement Specification:-**

### **2.1 Software Specification:-**

- Windows Xp, Windows 7(ultimate, enterprise)
- SQL 2008
- Notepad ++,Notepad
- Xampp Serve
- Front End:-Html,CSS
- Back End:-php ,mysql

### **2.2 Hardware Specification:-**

- Processor – i3
- Hard Disk – 5 GB
- Memory – 1GB RAM

### **3.0 Advantages and Disadvantages:-**

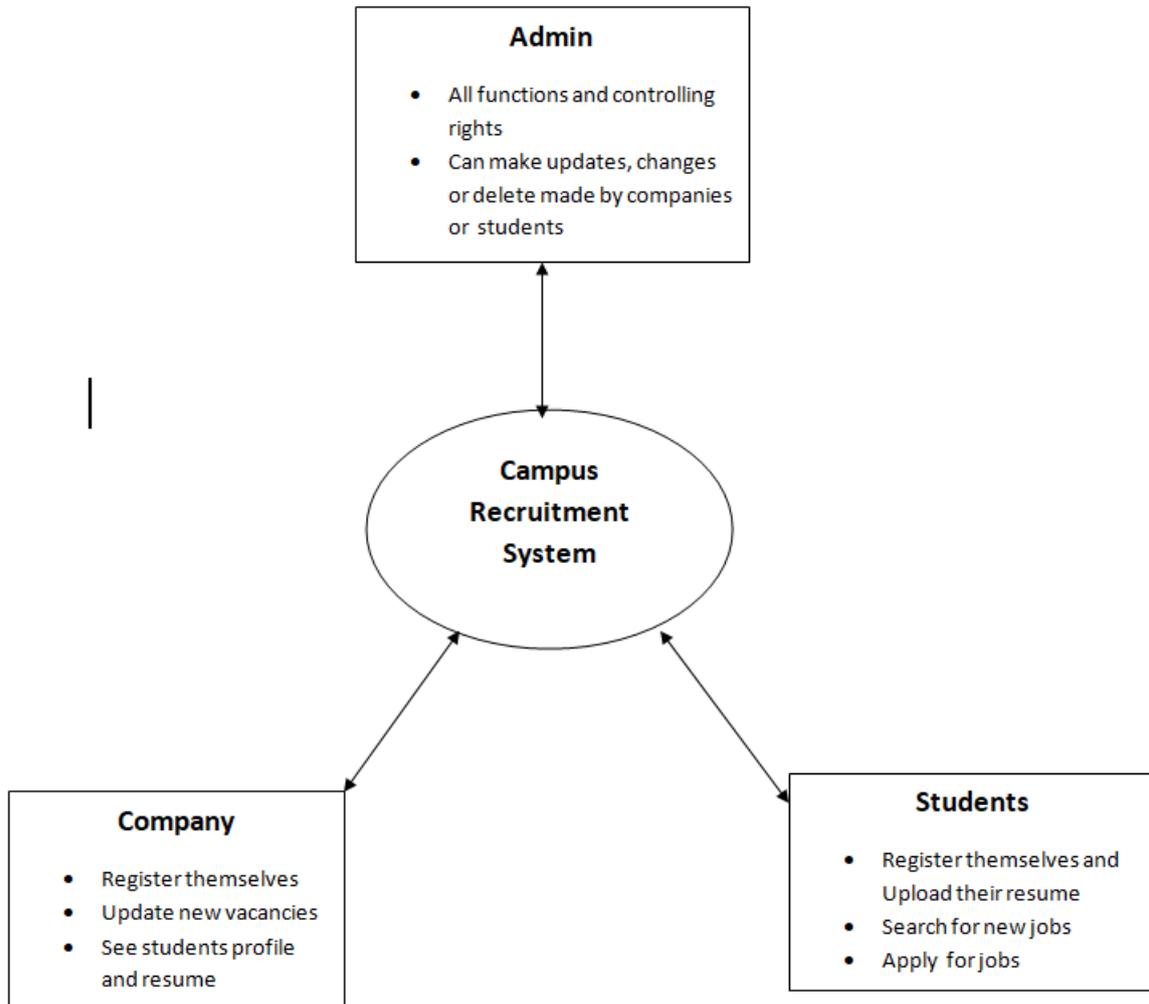

#### **3.1 Advantages:-**

- There will be no need of putting up notice or emailing every student about the company coming in college. The students can keep updated themselves through this software.
- The company can view all students' detail and system can shortlist students according to their criteria instead of doing manually.
- There is admin login that can view and manage both students and company's account and also can put up notifications.
- Student can register online instead of going to placement department for registration.
- This system saves time and efforts.

#### **3.2 Disadvantages:-**

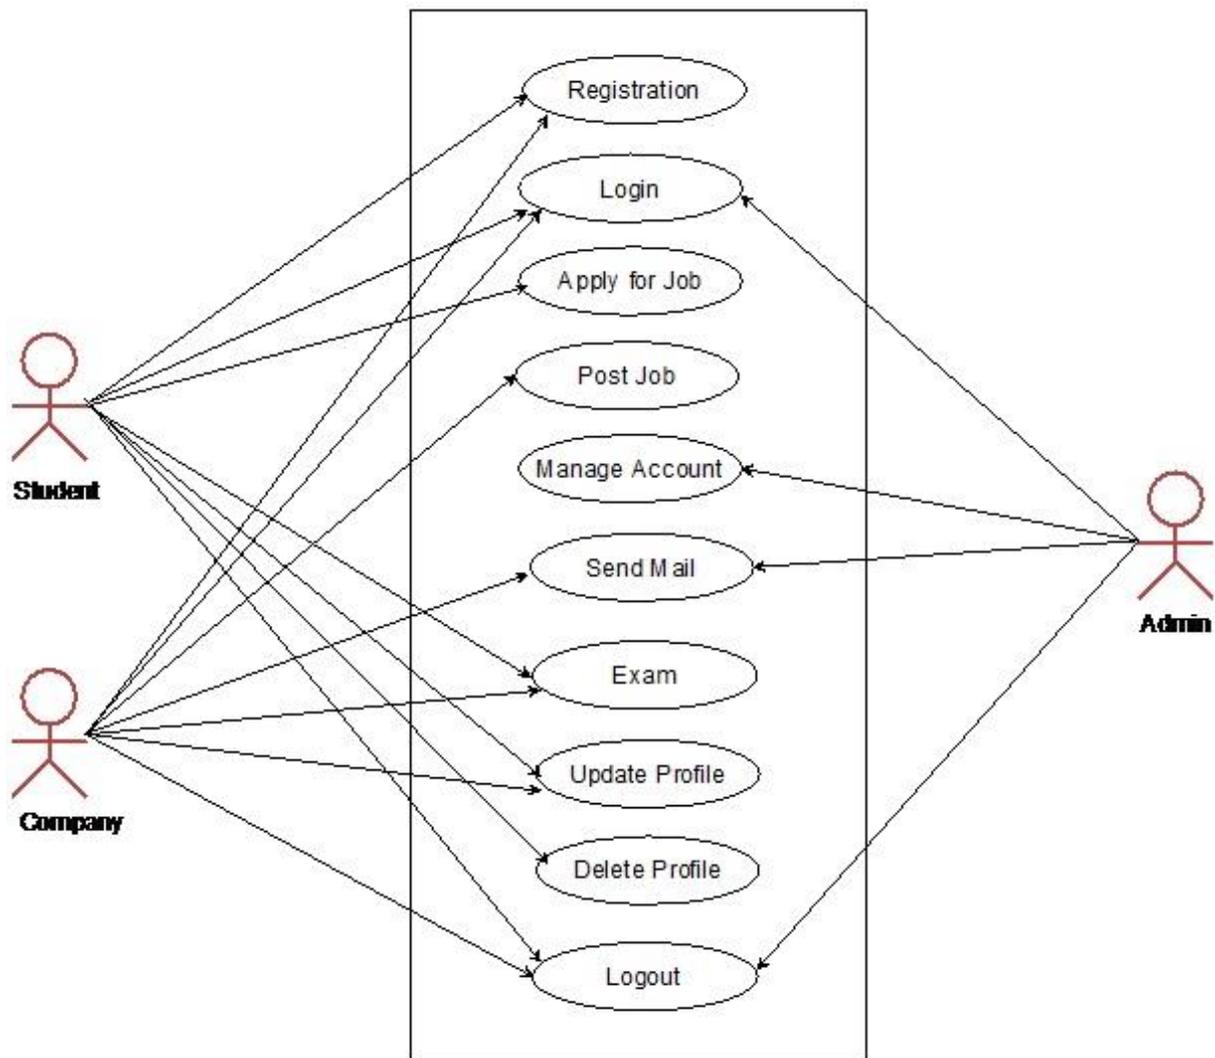

- Student can't edit their application once sent. It would require admin to change the data.
- It requires large database

## 4.0 Data Flow Diagram :-

## 6.0 Use Case Diagram:-

## 7.0 Class Diagram:-

## **8.0 Test Procedures:-**

**8.1 Unit Testing:-**This is lowest level of testing that is conducted to remove syntax and logic errors from a single unit. Individual components are tested that they operate correctly. Each components is tested independently. Without other system component.

**8.2 Module Testing :-:** A module is a collection of dependent components such as an object class, an abstract data type or some looser collection of procedures and function. A module encapsulate related components. So can be tested without other system module.

**8.3 Sub System Testing:-**This phase involve testing collection of modules which have been integrated into sub-system. This test for problem that arise from components interaction. This testing should begin as soon as usable version of some of the system components are available.

**8.4 System Testing:-:** The sub-system are integrated to make up the system. The system as a complete entity is tested over here. This process is concerned with finding errors that result from interaction between sub- system. It is also concerned with validating that the system meets its functional & nonfunctional requirement and testing the emergent system properties.

**8.5 Acceptance Testing :-:**This is the final stage in the testing process before the system is accepted for operational use. The System is tested with data supplied by the system customer rather than simulated test data. Acceptance Testing may reveal error & in the systems requirement definition because the real data exercise the system in different ways.

## **10.0 Conclusion:-**

Our project is only a humble venture to satisfy the needs to manage their project work. Several user friendly coding have also adopted. This package shall prove to be a powerful package in satisfying all the requirements of the school. The objective of software planning is to provide a frame work that enables the manger to make reasonable estimates made within a limited time frame at the beginning of the software project and should be updated regularly as the project progresses.

# INTRODUCTION TO THE APPLICATION

This is an online student profile event management system software project that serves the functionality of an event manager for all the events happening in college.

This is proposed to be a web application, a portal which provides most of the basic functionality required for an event. Faculty/Admin will post the details of an event on the portal and students can see the details and interested one's can register themselves for that particular event.

The system allows only registered users to login and new users are allowed to register on the application.

It allows the students to select from a list of events posted on the portal and can register for them as per their interest. Once the student's register for any event, the acknowledgement is given to the student and data of that student is logged in the database, the respective faculty will be able to see the details of registration and they may interact with the student as per their requirements and the data will help them take appropriate decisions regarding the events.

## EXISTING SYSTEM & ITS LIMITATIONS

An existing system refers to the system or pattern that is being currently followed.

1. In the existing Event Management System of our college, the faculty posts details about the events which are planned in the coming days and asks interested students to register for them on WhatsApp groups.
2. For every individual cell in college, events take place which leads to creation of multiple WhatsApp groups which causes confusion among the students.
3. Maintaining a list of all the events and their dates can be challenging for students in this system.

# PROPOSED APPLICATION AND ITS FEATURES

The proposed project is an easy way to register for any event of your interest among a list of all events happening in the college on a single portal online.

Our aim is to make the event registration process more user friendly and to promote academic networking among the users.

This is a web-based application that overcomes the issue of managing all the events taking place in the college according to user's choice or demands.

This project offers an effective solution where students can view all the events their dates and basic information on a single portal and register themselves.

If the registrations are closed, students will be notified that the registrations are closed. Students as well as Faculty can easily view all the event details on their home page.

Some of the features of our application are:

1. Student Registration and Login.
2. Faculty/Admin Login.
3. Student can view all the events on a single portal and register themselves then and there itself.
4. Students can view the registrations so that by watching their peer's interest they may be more inclined to participate.
5. Students can cancel their registration any time they want.
6. An engaging platform for all the students which will help them manage their schedule properly.

The Application can be used by non-programming personal, avoiding any human handled chance of errors, providing better user experience for the students/faculties.

# HARDWARE AND SOFTWARE REQUIREMENTS

## FRONT END

We are using latest versions of HTML/ CSS as our front end.

HTML is the language for describing the structure of Web pages.

HTML gives authors the means to publish online documents with headings, text, tables, lists, photos, etc. it also enables retrieval of online information via hypertext links, at the click of a button.

CSS is the language for describing the presentation of Web pages, including colors, layout, and fonts. It allows one to adapt the presentation to different types of devices, such as large screens, small screens, or printers.

## BACK END

We are using XAMPP server for our backend activities.

XAMPP is a free and open-source cross-platform web server. XAMPP is simply a local host or server that is used to test clients or websites before publishing them to a remote web server. The XAMPP server software on a local computer provides an appropriate environment for testing MYSQL, PHP, Apache, and Perl projects.

### **System requirements:**

1. Installation of latest version of XAMPP (8.0.17)

## MIDDLEWARE

We are using java servlets as our middleware.

A servlet is a Java-specific way of writing software that responds to HTTP requests. A language class that is used to extend the capabilities of servers that host applications accessed by means of a request-response programming model. Although servlets can respond to any type of request, they are commonly used to extend the applications hosted by web servers.

### **System requirements:**

2. Installation of latest version of the Eclipse (JAVA EE – 8)
3. Installation of Tomcat (10.0.16)

## DEVELOPMENT PLATFORM SPECIFICATIONS

OS Name - Microsoft Windows 10 Home Single Language

Version - 0.0.19042 Build 19042

Processor - Intel(R) Core (TM) i5-10210U CPU @ 1.60GHz, 2112  
Mhz, 4 Core(s), 8 Logical Processor(s)

System Type - x64-based PC

RAM - 8.00 GB

HDD - 1TB

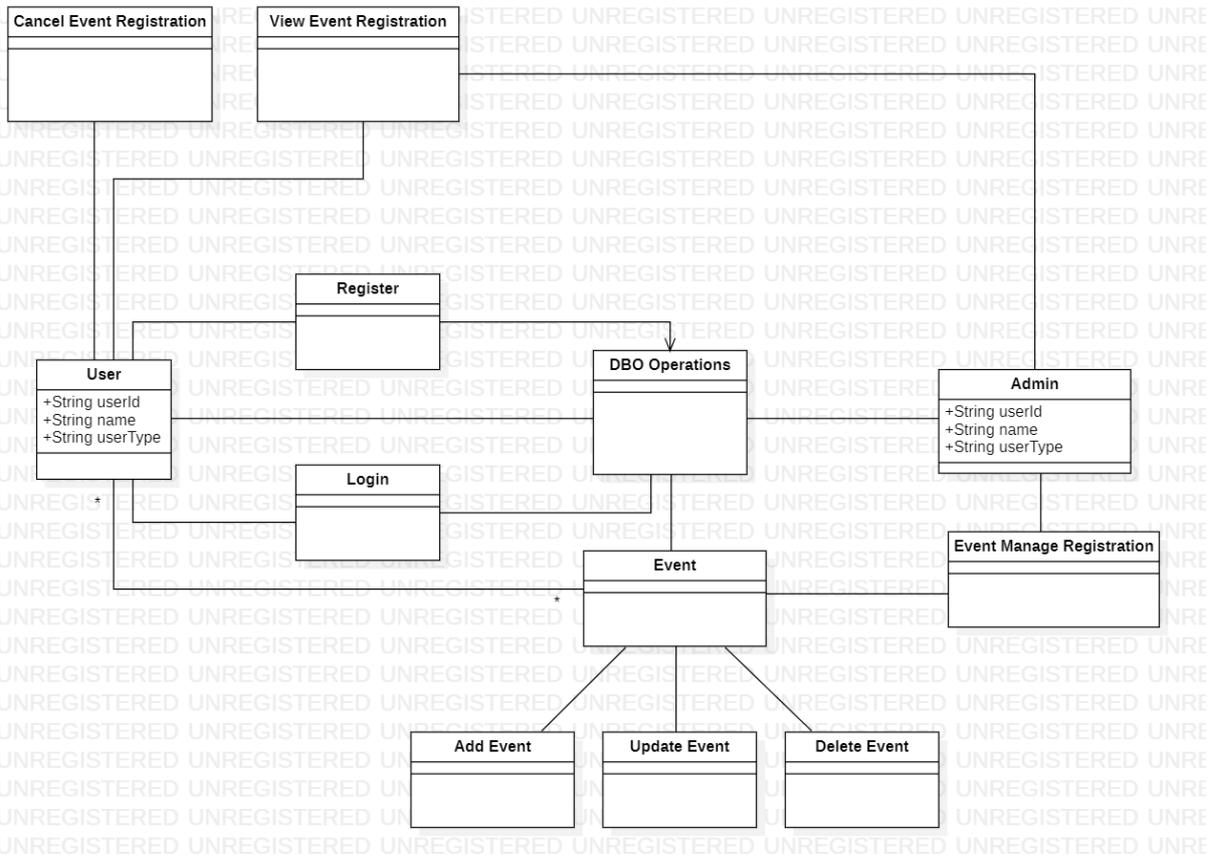

SSD - 256MB

SOCIETY'S INSTITUTE OF MANAGEMENT & CAREER COACHING (M.E.S.I.M.C.C.) and a navigation menu with "All Events", "Add Event", and "Sign Out". The "Add Event" form is displayed, titled "Cricket". It includes the following fields:

- Event Description:** A text area containing "Time", "Place", and "\*Rules\*".
- Event for:** A dropdown menu with "Both" selected.
- Post Creator:** A text input field containing "Atul Kalantre".
- 1st Winner:** A text input field containing "Maltreyi".

At the bottom of the form are three buttons: "Edit Event", "View Registrations", and "Delete Event".

## Edit Event Page

The screenshot shows a web browser window with the URL `localhost:3080/Sports_Event_Management_System/editEvent?id=19`. The page title is "College Events Portal" and the user is logged in as "Hello Sheetal Kalantre". The main header features the logo of M. E. SOCIETY'S INSTITUTE OF MANAGEMENT & CAREER COACHING (M.E.S.I.M.C.C.) and a navigation menu with "All Events", "Add Event", and "Sign Out". The "Edit Event" form is displayed, titled "Edit Event". It includes the following fields:

- Event Name:** A text input field containing "Cricket".
- Event Description:** A text area containing "Time", "Place", and "\*Rules\*".
- Event for:** Three radio buttons labeled "Male", "Female", and "Both", with "Both" selected.
- 1st Winner:** A text input field containing "Maltreyi".
- 2nd Winner:** A text input field containing "Name of Player/Team".
- 3rd Winner:** A text input field containing "Name of Player/Team".
- Post Creator:** A text input field containing "Sheetal Kalantre".

At the bottom of the form is a "Submit" button.

## View Registrations Page - Faculty

The screenshot shows a web browser window with the URL `localhost:8080/Sports_Event_Management_System/ViewRegistration?id=19`. The page header includes the logo of M. E. Society's Institute of Management & Career Courses (IMCC) and the text "College Events Portal" and "Hello Maltreyi Kalantre!". The main content area displays details for a "Cricket" event. The event description includes fields for "Time", "Place", and "Rules". The event is for "Both" genders and was created by "Atul Kalantre". Below this, a table titled "Registrations for Cricket" shows one registration record.

Sr. No.	Student Id	Student Name	Gender	Notes
1	2101058	Maltreyi Kalantre	Female	"notes"
